Date: 21/12/2025

Project Overview:

This project is focused on developing an AI model that will monitor and alert students about their attendance percentages. To demonstrate how the AI will function, we have built a basic attendance management system interface as a demo platform.

On Day 3, the project work mainly focused on reviewing and planning. The team revisited the existing system structure to ensure that all previously added features were functioning correctly. Time was spent checking the interface flow, confirming data storage performance, and preparing the project for the next development steps.

No new features were added on this day, but the system was reviewed to make sure there were no issues, errors, or interruptions. This planning process will help future development run more smoothly and efficiently.

Project progress continues to move forward according to the planned direction.
