Project Overview:

This project is focused on developing an AI model that will monitor and alert students about their attendance percentages. To demonstrate how the AI will function, we have built a basic attendance management system interface as a demo platform.

Today, the project improved from a basic demo into a more advanced and professional system.

The UI was redesigned with a modern glass-style layout. Data handling is better now, with duplicate entries grouped by Student ID. A new history window shows a student's attendance timeline, and users can fix errors directly inside it. Keyboard navigation is also smoother.

On the AI side, the system now automatically checks attendance percentages and highlights students below 75% in a red warning panel. The dashboard updates live with class averages and total records.

Progress increased from around 30% to around 75%. The project is moving strongly toward full completion.
